

Big news in the best mink weighing system in the world

On request from our users, HG WeightLog has once again been upgraded to be able to "Estimate animal" with a row of other user-friendly new actions.

1) Estimated weights (phantom animals)

The experience shows us, that mink – from time to another – does not 100 % want to use the HG weight inside the cage.

It has meant so far, that HG Weightlog has not shown any weight for the animal in few days – and it has again resulted in a weight curve for the entire farm, that has been able to get some strange fluctuations or holes on the curve below "statistic".

We have now extended the algorithm further, so it makes an estimated weight for the individual animal, based on the animal's previous weight curve. This will make the curve more accurate and user friendly for you.

11-397-6215-♀					

The small dots in **Green, yellow and Red** will still show how active the animal is – and are used by many fur breeders as an indicator for the welfare.

2) Increased user friendliness – especially on your mobile

The platform has been enhanced with additional information about cage numbers and color types directly to the mobile.

A good development, is the opportunity for the head types, to be divided into a color with "small, medium and big". It makes an easy and quick possibility on the mobile, to see the development more nuanced and up against the new breeding strategy from KF.

Otherwise, HG WeightLog will be as usual – easy, simple and a daily help for among other things the coming weight control 2020. Several new things will come - for example reel + FEEL temperature for your GPS location in your phone. We will get back to this in 2020.
