GWO Advanced Rescue Training – ART

GWO Advanced Rescue Training is a higher-level course over the basic 'Working at Heights' course and is aimed at employees in the wind industry.

The course teaches advanced rescue techniques in narrow, enclosed and not immediately accessible areas within a wind turbine. It could be in the nacelle, the blades or in the hub. AMU-Vest is a certified provider of the course, which fully complies to GWO standards.

MODULES AND REQUIREMENTS

The Advanced Rescue Training courses are divided into four modules, where we at AMU-Vest offer a package deal consisting of modules 1, 2 and one consisting of all four modules. Both are three day packages. Modules 1 and 2 must be refreshed after 24 months. The course requires that you are in good physical shape, as the practical training is challenging and with narrow means of access.

WHAT IS THE PROCESS?

On the 'ART' courses, you will specialise in rescuing each other from enclosed spaces that are difficult to access, where the person might be injured or has lost consciousness. The exercises take place in our own custom-made 'mock-up', which looks like a wind turbine on the inside, as well as in our outdoor wind turbine.

[DNV has stated that our facilities provide a great opportunity to train in a realistic environment]

In the practical training, we use stretchers, dummies, neck collars and safety equipment to simulate rescues. Safety and correct rigging is crucial to success of the objectives. Everyone will be trained to perform in the team leader function at the scene of the accident, focusing on safety, overview and coordination.

MODULES 1 AND 2: HUB RESCUE & NACELLE, TOWER & BASEMENT RESCUE

Module 1 ensures that participants can perform rescues of injured persons inside the wind turbine's 'hub, spinner and blades'. Module 2 takes place in a 'nacelle, tower and basement'. Methods and techniques are at a higher level than those used in the GWO 'Working at Heights' course.

Participants will learn to assess and decide on strategies as well as carry out a risk assessment of various rescue and evacuation scenarios.

The object of the course is to:

- explain and demonstrate suitable anchor points and lifting angles, as well as anticipate hazardous situations that may occur in confined spaces inside the different parts of the wind turbine.
- show the correct rescue techniques for climbing up and down.
- use the stretchers, neck collars and required safety equipment to bring the injured person safely out from the wind turbine.

Module 2 also contains:

- helicopter rescues from the wind turbine
- rescue of an injured person to a higher platform
- protecting the injured person from falling
- exercises in the team coordinator function

MODULES 3 & 4: SINGLE RESCUER (2X5 HOURS)

The same content as in modules 1 and 2. Except here, the exercises are only carried out by one person in the different parts of the wind turbine. These two modules do not require refresher courses.

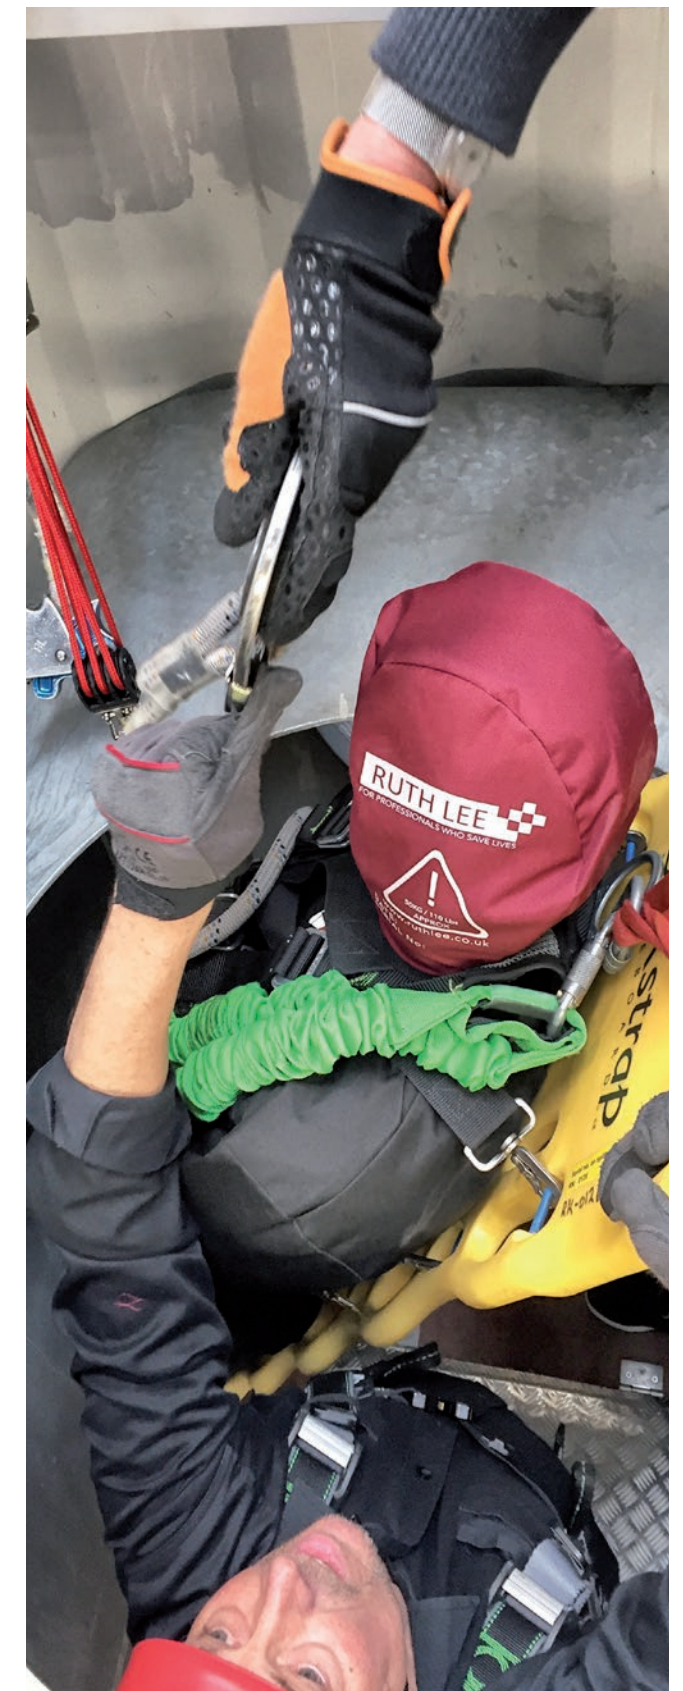

REFRESHER ART GWO MODULES 1 & 2

Modules 1 & 2 must be refreshed within 24 months. GWO Working At Heights+Manual Handling is included in the price.

FULL SERVICE

Administration and certificate monitoring AMU-Vest offers to help you and your company, find the right courses for your employees, arrange registration, apply for VEU reimbursement on behalf of the company, and also help with applying for possible competence funds.

We call it Full service - the concept and advice is completely free of charge for your company.

Read more about the Full Service on www.amu-vest.dk or contact AMU-Vest for further information on tel. 79 14 03 15 or 79 14 03 71.
